 Semantic Algebra can be traced back, far enough to "Trancedental Algebra" by Jacob Linzbach [1]

(ロ)、(型)、(E)、(E)、 E) のQの

- Semantic Algebra can be traced back, far enough to "Trancedental Algebra" by Jacob Linzbach [1]
- The original idea is that concepts should compose in a way that is realized by algebraic operations i + \$\\$ person with umbrella

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- Semantic Algebra can be traced back, far enough to "Trancedental Algebra" by Jacob Linzbach [1]
- The original idea is that concepts should compose in a way that is realized by algebraic operations i + \$\overline\$ person with umbrella

The problem is, that this addition is ambiguous

- Semantic Algebra can be traced back, far enough to "Trancedental Algebra" by Jacob Linzbach [1]
- The original idea is that concepts should compose in a way that is realized by algebraic operations i + \$\overline{1}\$ person with umbrella

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

The problem is, that this addition is ambiguous Does: man+ umbrella = man holding umbrella

- Semantic Algebra can be traced back, far enough to "Trancedental Algebra" by Jacob Linzbach [1]
- The original idea is that concepts should compose in a way that is realized by algebraic operations i + \$\\$ person with umbrella
- The problem is, that this addition is ambiguous
   Does: man+ umbrella = man holding umbrella
   or: man+ umbrella = man, umbrella, 5 light years away

- Semantic Algebra can be traced back, far enough to "Trancedental Algebra" by Jacob Linzbach [1]
- The original idea is that concepts should compose in a way that is realized by algebraic operations i + \$\\$ person with umbrella
- The problem is, that this addition is ambiguous
   Does: man+ umbrella = man holding umbrella
   or: man+ umbrella = man, umbrella, 5 light years away
- Although eventually this failed (for exactly this reason) we have still tried to organize concepts algebraicly

 Modern Computational capabilities have allowed for more complicated approaches to semantic algebra.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

#### Word2Vec

- Modern Computational capabilities have allowed for more complicated approaches to semantic algebra.
- in 2013, a paper by Mikolov detailed a way to organize words into a high dimensional real space using neural network.

・ロト・日本・モート モー うへぐ

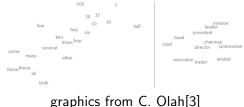

#### Word2Vec

- Modern Computational capabilities have allowed for more complicated approaches to semantic algebra.
- in 2013, a paper by Mikolov detailed a way to organize words into a high dimensional real space using neural network.

■ This network's task was to find an "Word Embedding" W:Words→ ℝ<sup>n</sup> [Mikolov][2]

#### Word2Vec

- Modern Computational capabilities have allowed for more complicated approaches to semantic algebra.
- in 2013, a paper by Mikolov detailed a way to organize words into a high dimensional real space using neural network.
- This network's task was to find an "Word Embedding" W:Words→ ℝ<sup>n</sup> [Mikolov][2]
- The result is a word embedding that places contextually relevant words close to each other.

# Magical Analogies

 A side effect of this word embedding, is that vector operations seemed to represent analogies

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

# Magical Analogies

- A side effect of this word embedding, is that vector operations seemed to represent analogies
- if you run vector operations, and you would get something like:

 $W("Woman") - W("Man") \simeq W("Queen") - W("King")$ 

#### These analogies are not magic

(ロ)、(型)、(E)、(E)、 E) の(の)

- These analogies are not magic
- they are built by the context of sentences in the training data.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- These analogies are not magic
- they are built by the context of sentences in the training data.
- Sentences like "The wall is red" and "the wall is blue" allow us to "swap" the words blue and red

- These analogies are not magic
- they are built by the context of sentences in the training data.
- Sentences like "The wall is red" and "the wall is blue" allow us to "swap" the words blue and red

 this is the meaning behind a vector operation like W("blue")-W("red")

 There are more sophisticated papers (such as doc2vec[4]) where we can contruct sentence embeddings

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- There are more sophisticated papers (such as doc2vec[4]) where we can contruct sentence embeddings
- something like "man + teacup" might give you a vector close to the sentence "man holding a teacup".

- There are more sophisticated papers (such as doc2vec[4]) where we can contruct sentence embeddings
- something like "man + teacup" might give you a vector close to the sentence "man holding a teacup".
- But this is ambiguous and highly dependent on the training data.

- There are more sophisticated papers (such as doc2vec[4]) where we can contruct sentence embeddings
- something like "man + teacup" might give you a vector close to the sentence "man holding a teacup".
- But this is ambiguous and highly dependent on the training data.

depending on your training data, from British novelists

- "Man holding a teacup"
- "Man swimming in a teacup"
- "A man and a teacup exist"

This ambiguity is exactly the issue...

(ロ)、(型)、(E)、(E)、 E) の(の)

- This ambiguity is exactly the issue...
- Can we define an unambiguous "addition" that makes semantic sense?

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- This ambiguity is exactly the issue...
- Can we define an unambiguous "addition" that makes semantic sense?
- One that, If still generated by contextual biases, at least allows us to understand those biases

- This ambiguity is exactly the issue...
- Can we define an unambiguous "addition" that makes semantic sense?
- One that, If still generated by contextual biases, at least allows us to understand those biases
- We already have a model of how concepts relate to other concepts contextually

- This ambiguity is exactly the issue...
- Can we define an unambiguous "addition" that makes semantic sense?
- One that, If still generated by contextual biases, at least allows us to understand those biases
- We already have a model of how concepts relate to other concepts contextually

• What we lack is a model for a concept, *internally* 

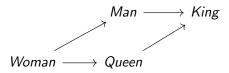

- This ambiguity is exactly the issue...
- Can we define an unambiguous "addition" that makes semantic sense?
- One that, If still generated by contextual biases, at least allows us to understand those biases
- We already have a model of how concepts relate to other concepts contextually
- What we lack is a model for a concept, *internally*
- To differentiate between "Man holding a teacup" and "Man swimming in a teacup", we should consult the internals of the sum Man + Teacup

I think we already have it I am talking about category theory

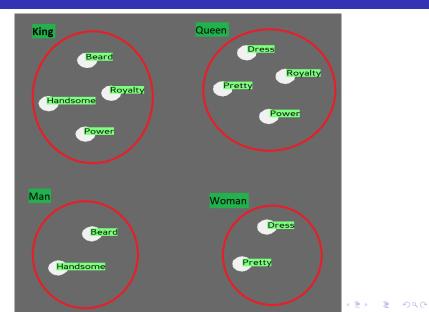

#### Concepts are Sets?

- the goal is to create unambiguous conceptual addition by consulting the internals of a concept
- Our universe for concepts was a vector space, but let's now consider this as a (directed) graph

- from this perspective, we can see the nodes clearly
- let's give some data to these nodes
- assume each node is instead a set

# Man, Woman, King, Queen as Sets

## Algebraic Operations on Sets

#### define set "addition" to be the union

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

- define set "addition" to be the union
- define set "subtraction" to be excision

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- define set "addition" to be the union
- define set "subtraction" to be excision
- denote the set associated to a concept A by O(A) then:

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- define set "addition" to be the union
- define set "subtraction" to be excision
- denote the set associated to a concept A by O(A) then:

 $O(King) = { 'beard', 'power', 'handsome', 'royalty' }$ 

- define set "addition" to be the union
- define set "subtraction" to be excision
- denote the set associated to a concept A by O(A) then:

$$\begin{split} O(\mathsf{King}) &= \{\texttt{'beard', 'power', 'handsome', 'royalty'} \} \\ O(\mathsf{King}) - O(\mathsf{Man}) &= \{\texttt{'power', 'royalty'} \} \end{split}$$

- define set "addition" to be the union
- define set "subtraction" to be excision
- denote the set associated to a concept A by O(A) then:

$$\begin{split} O(King) &= \{'beard', 'power', 'handsome', 'royalty'\}\\ O(King) - O(Man) &= \{'power', 'royalty'\}\\ O(King) - O(Man) + O(Woman) &= \\ \{'dress', 'power', 'pretty', 'royalty'\} &= O(Queen) \end{split}$$

We can describe a "universe with a man and a teacup" using disjoint union:

 $O(Universe with man and teacup) = O(Man) \prod O(teacup)$ 

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

We can describe a "universe with a man and a teacup" using disjoint union:

 $O(Universe with man and teacup) = O(Man) \prod O(teacup)$ 

but we lack the expressive power to describe a "man holding a teacup" as some operation We can describe a "universe with a man and a teacup" using disjoint union:

 $O(Universe with man and teacup) = O(Man) \prod O(teacup)$ 

- but we lack the expressive power to describe a "man holding a teacup" as some operation
- the conceptual sets of "man" and "teacup" do not share any underlying concepts (like king and queen did) so their union will always be disjoint

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Sets lack the expressive power for internal relationshipswe may be tempted to choose graphs

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- we may be tempted to choose graphs
- but even these lack power: no composition

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- we may be tempted to choose graphs
- but even these lack power: no composition
- we can go on an on choosing better and better models:

- we may be tempted to choose graphs
- but even these lack power: no composition
- we can go on an on choosing better and better models:Simplicial Sets,

- we may be tempted to choose graphs
- but even these lack power: no composition
- we can go on an on choosing better and better models:Simplicial Sets, Higher Simplicial Sets,

- Sets lack the expressive power for internal relationships
- we may be tempted to choose graphs
- but even these lack power: no composition
- we can go on an on choosing better and better models:Simplicial Sets, Higher Simplicial Sets, Topological Spaces, Vector Spaces, Hilbert Spaces ...

- Sets lack the expressive power for internal relationships
- we may be tempted to choose graphs
- but even these lack power: no composition
- we can go on an on choosing better and better models:Simplicial Sets, Higher Simplicial Sets, Topological Spaces, Vector Spaces, Hilbert Spaces ...
- before choosing a "best" model to describe the internals let's agree on how to work with any model

## Lifting to arbitrary objects

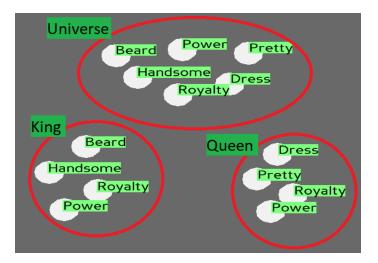

- Let's just assume that whatever models we have, they live inside of some category €
- We can recast our union and excision in categorical semantics alone

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

This concept is known as a Universal Property

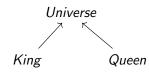

- 1) Our concept's internals are objects of some category
- 2) There is some Universe object (to compare concepts)
- 3) (For the categorically minded)  $\mathfrak C$  must also be co/complete with a terminal and initial object

## Universe Example

◆□ > ◆□ > ◆ 三 > ◆ 三 > 三 のへで

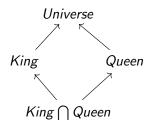

## Intersection is Pullback

begin with our embeddings into our universe set

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

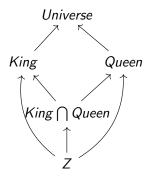

### Intersection is Pullback

begin with our embeddings into our universe set The intersection is something that embeds into both concepts

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ○臣 - の々ぐ

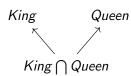

### Intersection is Pullback

begin with our embeddings into our universe set The intersection is something that embeds into both concepts And it is the biggest thing that embeds into both concets

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 三臣 - のへで

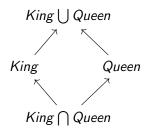

## Union is Pushout

Now that we have our intersection

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

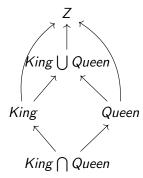

### Union is Pushout

Now that we have our intersection Both concepts embed into the union Such that it's intersection goes to the same place

◆□ > ◆□ > ◆臣 > ◆臣 > ─ 臣 ─ のへで

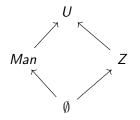

### Union is Pushout

Now that we have our intersection Both concepts embed into the union Such that it's intersection goes to the same place The Union is the smallest thing that does this

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

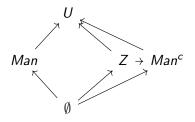

## Compliment and set subtraction

Assume that some concept and another have empty intersection

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

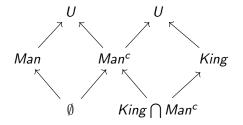

### Compliment and set subtraction

The "Compliment" of that concept is the largest thing with empty intersection

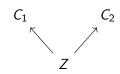

・ロット (雪) ( ) ( ) ( ) ( )

## Compliment and set subtraction

We can then combine the intersection and the compliment to for the subtraction  $King - Man = King \bigcap Man$ 

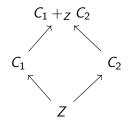

# Gluing

Without the "Universe" Object to compare the internals of two concepts, we can still "force" two objects together by asserting their intersection

▲□▶ ▲圖▶ ★ 国▶ ★ 国▶ - 国 - のへで

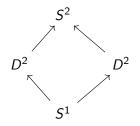

# Gluing

Using a universality condition, we can find a "best" concept to complete the diagram

▲□▶ ▲圖▶ ★ 国▶ ★ 国▶ - 国 - のへで

# Gluing

The Classic example is gluing two disks together by their boundary circle to get a sphere

▲□▶ ▲圖▶ ★ 国▶ ★ 国▶ - 国 - のへで

We Came up with a case for describing the internals of a concept

We Came up with a case for describing the internals of a concept

• We tried this with sets, discussed some algebra of sets

- We Came up with a case for describing the internals of a concept
- We tried this with sets, discussed some algebra of sets
- We found some downside with the expressability of sets

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- We Came up with a case for describing the internals of a concept
- We tried this with sets, discussed some algebra of sets
- We found some downside with the expressability of sets
- We generalized our operations from sets to arbitrary "nice" categories

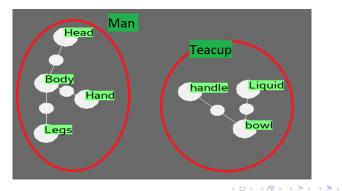

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Now let's talk about some specific categories

#### Concepts as Graphs

- so now the question is, can we use our conceptual algebra to differentiate the possible man + teacup compositions
- Lets lift our internal conceptual representations from Set to Graph

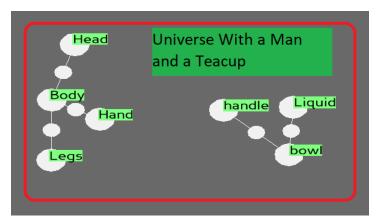

So for example, man and teacup:

э.

# Graph Disjoint Union

As it is, we can still define the disjoint union of these two graphs. This will give us a "Universe With an Man and a Teacup":

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

# Let's define two 1-edge graphs that will represent "Holds" and "Swims"

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Let's define two 1-edge graphs that will represent "Holds" and "Swims"  $H = \{supporter \xrightarrow{holds} supported\}$ 

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

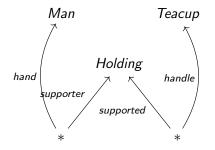

Let's define two 1-edge graphs that will represent "Holds" and "Swims"

- $H = \{supporter \stackrel{holds}{\rightarrow} supported\}$
- $S = \{ Under \stackrel{swims}{\rightarrow} Liquid \}$

Let's define two 1-edge graphs that will represent "Holds" and "Swims"  $H = \{supporter \xrightarrow{holds} supported\}$ 

 $S = \{ Under \xrightarrow{swims} Liquid \}$ And the one point graph with no edge \* \* =  $\{\bullet\}$ 

#### Man holding teacup

Consider the diagram H a subcategory of graph The shown functions send the single point  $\bullet$ to the name of the function. e.g. hand( $\bullet$ ) = hand

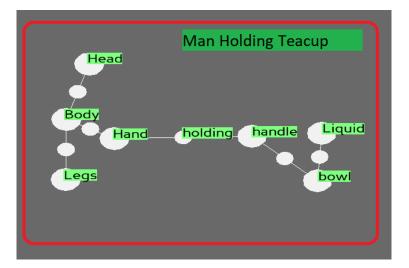

#### Man holding teacup

By gluing H (Universality) We can construct a conceptual addition Man  $+_S$  Teacup

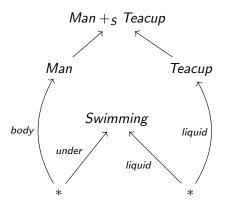

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ ─臣 ─のへで

#### Man Holding Teacup

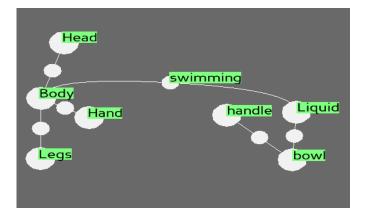

◆□ > ◆□ > ◆□ > ◆□ > ◆□ > ○ < ○

Of course, now we can do this for "swimming" as well

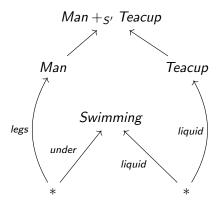

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

# Man Swimming in Teacup

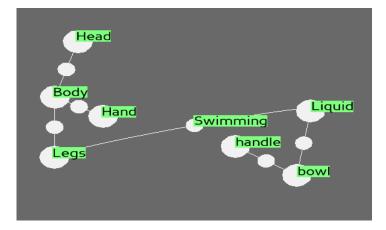

Of course, now we can do this for "swimming" as well

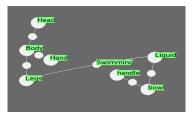

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQ@

# Man Wading in Teacup

# Graphs: Externally and Internally

- but remember that our original "concept space" is also a graph
- on the inside it looks something like this:

on the inside I have the categorical semantics to define

```
"man +_S teacup"
```

but on the outside I do not ...

 If, on the outside, I had some categorical structure I might be able to compare universal properties

 realizing the inside of concepts in some category, we can construct universal properties

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- realizing the inside of concepts in some category, we can construct universal properties
- if the outside "collection of concepts" formed a category as well, we could derive universal properties before expanding

- realizing the inside of concepts in some category, we can construct universal properties
- if the outside "collection of concepts" formed a category as well, we could derive universal properties before expanding
- upon expansion we will better realize what was meant, but before then, we should still be able to guess

If both the inside and outside are objects in the same category, then we can do multiple "expansions"

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

- If both the inside and outside are objects in the same category, then we can do multiple "expansions"
- That is, both the external collection of concepts, and internals of particular concept, should be categories

- If both the inside and outside are objects in the same category, then we can do multiple "expansions"
- That is, both the external collection of concepts, and internals of particular concept, should be categories
- this way, the inside universal property and the outside Universal property "guess" can agree up to some functorality condition

- If both the inside and outside are objects in the same category, then we can do multiple "expansions"
- That is, both the external collection of concepts, and internals of particular concept, should be categories
- this way, the inside universal property and the outside Universal property "guess" can agree up to some functorality condition

 further, the elements on the inside of a concept can be expanded to provide more details

- If both the inside and outside are objects in the same category, then we can do multiple "expansions"
- That is, both the external collection of concepts, and internals of particular concept, should be categories
- this way, the inside universal property and the outside Universal property "guess" can agree up to some functorality condition

 further, the elements on the inside of a concept can be expanded to provide more details (This is the role of ontological expansion)
