Part 3: Higher Categories: Simplicial sets, Python Ologs

- *Cat* as a 2-category
- Simplicial Sets
- Functorality as Naturality
- Pythonic Simplicial Sets
- Face and Degeneracy as ontological expansions

Ontological Log

An Ontological Log is a labeled category.

- I.e. labeled objects and labeled morphisms
- An ontology represents concepts and their relations via category theory

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

An ontology itself is a category of concepts

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- An ontology itself is a category of concepts
- An ontology can also represent the subconcepts of a single concept.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- An ontology itself is a category of concepts
- An ontology can also represent the subconcepts of a single concept.
- We want to obtain the ontologies describing single concepts.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- An ontology itself is a category of concepts
- An ontology can also represent the subconcepts of a single concept.
- We want to obtain the ontologies describing single concepts.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

This is formalized by an ontological expansion

■ The Naive guess is a functor O : C → Cat (Doesn't tell us how to relate subconcepts in O(c) to O(c'))

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- The Naive guess is a functor O : C → Cat (Doesn't tell us how to relate subconcepts in O(c) to O(c'))
- Another guess is that there is some "universe" category D with O : C → (Cat ↓ D)

(Gives relations between subconcepts, but naturality is too restrictive)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

■ The Naive guess is a functor O : C → Cat (Doesn't tell us how to relate subconcepts in O(c) to O(c'))

 Another guess is that there is some "universe" category D with O: C → (Cat ↓ D) (Gives relations between subconcepts, but naturality is too restrictive)

removing the naturality conditions the morphisms of $(\mathfrak{C}at \downarrow \mathfrak{D})$ are collections of morphisms between images of small functors J,J':

- The Naive guess is a functor O : C → Cat (Doesn't tell us how to relate subconcepts in O(c) to O(c'))
- Another guess is that there is some "universe" category D with O: C → (Cat ↓ D) (Gives relations between subconcepts, but naturality is too restrictive)

removing the naturality conditions the morphisms of $(\mathfrak{C}at \downarrow \mathfrak{D})$ are collections of morphisms between images of small functors J,J':

Submorphism

A submorphism $\mathcal{F}: J \to J'$ is a set of maps between the images of J and J'

This forms a category of small functors $J : S \to \mathfrak{D}$ and submorphisms, $sm(\mathfrak{D})$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

This forms a category of small functors $J: S \to \mathfrak{D}$ and submorphisms, $sm(\mathfrak{D})$. This construction is actually functorial $sm: \mathfrak{C}at \to \mathfrak{C}at$

This forms a category of small functors $J: S \to \mathfrak{D}$ and submorphisms, $sm(\mathfrak{D})$. This construction is actually functorial $sm: \mathfrak{C}at \to \mathfrak{C}at$

Ontological Expansion

an **Ontological Expansion** is a functor $O: \mathfrak{C} \to sm(\mathfrak{D})$

■ For a cocomplete category 𝔅, the colimit forms a functor colim : (𝔅at ↓ 𝔅) → 𝔅

(ロ)、(型)、(E)、(E)、 E) の(の)

■ For a cocomplete category 𝔅, the colimit forms a functor colim : (𝔅at ↓ 𝔅) → 𝔅

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

■ The colimit also comes with a collection of "canonical morphisms" {η_s : J(s) → colim(J)}

- For a cocomplete category 𝔅, the colimit forms a functor colim : (𝔅at ↓ 𝔅) → 𝔅
- The colimit also comes with a collection of "canonical morphisms" {η_s : J(s) → colim(J)}
- we want an analog for the colimit in sm(𝔅), i.e. a functor colim : sm(𝔅) → 𝔅 with a collection {η_s : J(s) → colim(J)}

- For a cocomplete category 𝔅, the colimit forms a functor colim : (𝔅at ↓ 𝔅) → 𝔅
- The colimit also comes with a collection of "canonical morphisms" {η_s : J(s) → colim(J)}
- we want an analog for the colimit in sm(𝔅), i.e. a functor colim : sm(𝔅) → 𝔅 with a collection {η_s : J(s) → colim(J)}
- the intuition behind the functorality of colim, is that we should be able to deduce relations between concepts from the relations of their ontological expansion (i.e. colim(submorphism) = morphism)

- For a cocomplete category 𝔅, the colimit forms a functor colim : (𝔅at ↓ 𝔅) → 𝔅
- The colimit also comes with a collection of "canonical morphisms" {η_s : J(s) → colim(J)}
- we want an analog for the colimit in sm(𝔅), i.e. a functor colim : sm(𝔅) → 𝔅 with a collection {η_s : J(s) → colim(J)}
- the intuition behind the functorality of colim, is that we should be able to deduce relations between concepts from the relations of their ontological expansion (i.e. colim(submorphism) = morphism)

in this case, for an ontological expansion $O : \mathfrak{C} \to sm(\mathfrak{D})$ we then have a covering $\{\eta_s : O(c)(s) \to colim(O(c))\}$

$$O: \mathfrak{C} \to sm(\mathfrak{C})$$
 and $colim(O(c)) = c$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

$$O: \mathfrak{C}
ightarrow sm(\mathfrak{C})$$
 and $colim(O(c)) = c$

we get a covering $\{O(c)(s)
ightarrow c\}$ of c by its expansion

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

 $O: \mathfrak{C} \to sm(\mathfrak{C})$ and colim(O(c)) = c

we get a covering $\{O(c)(s) \rightarrow c\}$ of c by its expansion

The intuition behind these assertions is that an ontological expansion O(c) actually describes c

 $O: \mathfrak{C}
ightarrow sm(\mathfrak{C})$ and colim(O(c)) = c

we get a covering $\{O(c)(s) \rightarrow c\}$ of c by its expansion

The intuition behind these assertions is that an ontological expansion O(c) actually describes c

This assertion is the first condition of an Ontological Generator

Anisotropy and \$

 Ontological Expansion tells us how to construct ontologies that describe a given concept

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Anisotropy and \$

 Ontological Expansion tells us how to construct ontologies that describe a given concept

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

In general, there is more than one ontological expansion

 Ontological Expansion tells us how to construct ontologies that describe a given concept

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

In general, there is more than one ontological expansion

For example, we can describe a cat by O(cat) = macroscopic body parts, or O'(cat) = cellular anatomy

 Ontological Expansion tells us how to construct ontologies that describe a given concept

In general, there is more than one ontological expansion

```
For example, we can describe a cat by O(cat) = macroscopic body parts, or O'(cat) = cellular anatomy
```

Goal

To organize different expansions and how they relate

Anisotropy and \$

• The idea is that these ontological expansion functors are actually part of a parameterized functor OG_s , which we will call an **ontological generator**

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Anisotropy and \$

The idea is that these ontological expansion functors are actually part of a parameterized functor OG_s, which we will call an **ontological generator**

The **intuition** is that different ontological expansions all describe the objects they expand, but may be more costly (cellular anatomy is much more data than macroscopic body parts)

The idea is that these ontological expansion functors are actually part of a parameterized functor OG_s, which we will call an **ontological generator**

The **intuition** is that different ontological expansions all describe the objects they expand, but may be more costly (cellular anatomy is much more data than macroscopic body parts)

We also want to relate two ontological expansions
 So our proto-definition of an ontological generator is now a functor

$$OG: \$ \to sm(\mathfrak{C})^{\mathfrak{C}}$$

- recall that $sm : \mathfrak{C}at \to \mathfrak{C}at$ is a functor
- given $O : \mathfrak{C} \to sm(\mathfrak{C}), sm(O) : sm(\mathfrak{C}) \to sm(sm(\mathfrak{C}))$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

- recall that $sm : \mathfrak{C}at \to \mathfrak{C}at$ is a functor
- given $O: \mathfrak{C} \to sm(\mathfrak{C}), sm(O): sm(\mathfrak{C}) \to sm(sm(\mathfrak{C}))$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

• also $\operatorname{colim}:\operatorname{sm}(\operatorname{sm}(\mathfrak{C}))\to\operatorname{sm}(\mathfrak{C})$

- recall that $sm : \mathfrak{C}at \to \mathfrak{C}at$ is a functor
- given $O: \mathfrak{C} \to sm(\mathfrak{C}), sm(O): sm(\mathfrak{C}) \to sm(sm(\mathfrak{C}))$
- also $colim : sm(sm(\mathfrak{C})) \to sm(\mathfrak{C})$

given two ontological expansions $O, O' : \mathfrak{C} \to sm(\mathfrak{C})$ we can create a composable chain:

$$\mathfrak{C} \stackrel{O}{\rightarrow} \mathit{sm}(\mathfrak{C}) \stackrel{\mathit{sm}(O')}{\rightarrow} \mathit{sm}(\mathit{sm}(\mathfrak{C})) \stackrel{\mathit{colim}}{\rightarrow} \mathit{sm}(\mathfrak{C})$$

- recall that $sm : \mathfrak{C}at \to \mathfrak{C}at$ is a functor
- given $O: \mathfrak{C} \to sm(\mathfrak{C}), sm(O): sm(\mathfrak{C}) \to sm(sm(\mathfrak{C}))$
- also $colim : sm(sm(\mathfrak{C})) \to sm(\mathfrak{C})$

given two ontological expansions $O, O' : \mathfrak{C} \to sm(\mathfrak{C})$ we can create a composable chain:

$$\mathfrak{C} \stackrel{O}{\rightarrow} \mathit{sm}(\mathfrak{C}) \stackrel{\mathit{sm}(O')}{\rightarrow} \mathit{sm}(\mathit{sm}(\mathfrak{C})) \stackrel{\mathit{colim}}{\rightarrow} \mathit{sm}(\mathfrak{C})$$

This composition yeilds the spiral product

$$O' \mathfrak{O} O = colim \circ sm(O') \circ O$$

$$O' \mathfrak{D} O = colim \circ sm(O') \circ O$$

The **intuition** behind the spiral product is that we are aggregating two ontological expansions into one big one:

First expand an object c to an ontology O(c)

$$O' \mathfrak{D} O = colim \circ sm(O') \circ O$$

The **intuition** behind the spiral product is that we are aggregating two ontological expansions into one big one:

- First expand an object c to an ontology O(c)
- Then expand the objects c' of O(c) to an ontologies O'(c')

$$O' \mathfrak{D} O = colim \circ sm(O') \circ O$$

The **intuition** behind the spiral product is that we are aggregating two ontological expansions into one big one:

- First expand an object c to an ontology O(c)
- Then expand the objects c' of O(c) to an ontologies O'(c')
- Finally collect ontologies into one large on that "looks like"

$$\bigcup_{c'\in O(c)}O'(c')$$

(careful, in general the spiral product isn't just an ordinary union)

consider a (proto-)ontological generator $OG: \$
ightarrow sm(\mathfrak{C})^{\mathfrak{C}}$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

$$OG(s' \otimes s) = OG(s)$$
 $OG(s')$

$$OG(s' \otimes s) = OG(s)$$
 $OG(s')$

In this case:

a) OG is closed under the spiral product

$$OG(s'\otimes s)=OG(s)$$
9 $OG(s')$

In this case:

- a) OG is closed under the spiral product
- b) \$ tells us how to compose ontological expansions in OG

$$OG(s'\otimes s)=OG(s)$$
9 $OG(s')$

In this case:

- a) OG is closed under the spiral product
- b) \$ tells us how to compose ontological expansions in OG

Consider an $\mathit{OG}: \$ \to \mathit{sm}(\mathfrak{C})^{\mathfrak{C}}$ satisfying $\mathsf{colim}(\mathsf{OG}_{s}(c)) = c$

Consider an $OG : \$ \to sm(\mathfrak{C})^{\mathfrak{C}}$ satisfying $\operatorname{colim}(OG_s(c)) = c$ Let $Cov = \{OG_s(c) \to c\}_{s \in \$, c \in \mathfrak{C}}$

Consider an $OG : \$ \to sm(\mathfrak{C})^{\mathfrak{C}}$ satisfying $\operatorname{colim}(OG_s(c)) = c$ Let $Cov = \{OG_s(c) \to c\}_{s \in \$, c \in \mathfrak{C}}$ The final assumption is that Cov makes \mathfrak{C} into a **site**

Consider an $OG : \$ \to sm(\mathfrak{C})^{\mathfrak{C}}$ satisfying $\operatorname{colim}(OG_s(c)) = c$ Let $Cov = \{OG_s(c) \to c\}_{s \in \$, c \in \mathfrak{C}}$ The final assumption is that Cov makes \mathfrak{C} into a **site**

intuition

We want to actually measure data about the objects of \mathfrak{C} . The site assumption allows us to formalize data in terms of sheaves $\mathscr{F}: \mathfrak{C} \to \mathfrak{D}$.

Consider an $OG : \$ \to sm(\mathfrak{C})^{\mathfrak{C}}$ satisfying $\operatorname{colim}(OG_s(c)) = c$ Let $Cov = \{OG_s(c) \to c\}_{s \in \$, c \in \mathfrak{C}}$ The final assumption is that Cov makes \mathfrak{C} into a **site**

intuition

We want to actually measure data about the objects of \mathfrak{C} . The site assumption allows us to formalize data in terms of sheaves $\mathscr{F}:\mathfrak{C}\to\mathfrak{D}$.

Moreover given an ontological expansion $OG_s(c)$, we can use the sheaf condition to "glue together" data from $c' \in OG_s(c)$ to c-data

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Ontological Generator

An **ontological generator** is a functor $OG : \$ \rightarrow sm(\mathfrak{C})^{\mathfrak{C}}$ such that:

Ontological Generator

An **ontological generator** is a functor $OG : \$ \to sm(\mathfrak{C})^{\mathfrak{C}}$ such that:

1) colim \circ OG(s) = Id_{\mathfrak{C}}, $\forall s \in$ \$

Ontological Generator

An **ontological generator** is a functor $OG : \$ \rightarrow sm(\mathfrak{C})^{\mathfrak{C}}$ such that:

1) colim \circ OG(s) = Id_C, $\forall s \in$ 2) OG(s' \otimes s) = OG(s') \Im OG(s)

Ontological Generator

An **ontological generator** is a functor $OG : \$ \to sm(\mathfrak{C})^{\mathfrak{C}}$ such that:

1) colim
$$\circ$$
 OG(s) = Id_C, $\forall s \in$
2) OG(s' \otimes s) = OG(s') \bigcirc OG(s)
3) Cov = {OG(s)(c) \rightarrow c}_{s \in \$,c \in C} makes \mathfrak{C} into a site

The point of this section is to recast the colimit as an initial object in some category

The point of this section is to recast the colimit as an initial object in some category

- $\mathfrak{C}at$ as a category, sm, $fun : \mathfrak{C}at \to \mathfrak{C}at$
- $\blacksquare \Delta: \mathit{Id}_{\mathfrak{Cat}} \to \mathit{fun}$
- colim : $fun(\mathfrak{C}) \to \mathfrak{C}$
- $\eta: Id \to \Delta \circ colim$ is initial in $\mathscr{L}_{fun,\mathfrak{C}}$

The point of this section is to recast the colimit as an initial object in some category

- $\mathfrak{C}at$ as a category, sm, $fun : \mathfrak{C}at \to \mathfrak{C}at$
- $\Delta: Id_{\mathfrak{Cat}} \to fun$
- colim : $fun(\mathfrak{C}) \to \mathfrak{C}$
- $\eta: Id \to \Delta \circ colim$ is initial in $\mathscr{L}_{fun,\mathfrak{C}}$
- Conjecture: $\eta: Id \to \Delta \circ colim$ is initial in $\mathscr{L}_{sm,\mathfrak{C}}$

The category of small categories is actually a category itself

The category of small categories is actually a category itself

- \blacksquare The objects are small categories $\mathfrak{C},\mathfrak{D}$
- The morphisms are functors $F : \mathfrak{C} \to \mathfrak{D}$

- The category of small categories is actually a category itself
- \blacksquare The objects are small categories $\mathfrak{C},\mathfrak{D}$
- The morphisms are functors $F : \mathfrak{C} \to \mathfrak{D}$

From a small category \mathfrak{C} we can form the overcategory $(\mathfrak{C}at \downarrow \mathfrak{C})$:

$(\mathfrak{C}at \downarrow \mathfrak{C})$

- The category of small categories is actually a category itself
- \blacksquare The objects are small categories $\mathfrak{C},\mathfrak{D}$
- The morphisms are functors $F : \mathfrak{C} \to \mathfrak{D}$

From a small category \mathfrak{C} we can form the overcategory ($\mathfrak{C}at \downarrow \mathfrak{C}$):

- objects are functors $J: S \to \mathfrak{C}$
- morphisms are pairs $(P: S \rightarrow S', \phi: J \rightarrow J' \circ P)$

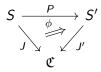

$(\mathfrak{C}at \downarrow \mathfrak{C})$

- The category of small categories is actually a category itself
- \blacksquare The objects are small categories $\mathfrak{C},\mathfrak{D}$
- The morphisms are functors $F : \mathfrak{C} \to \mathfrak{D}$

From a small category \mathfrak{C} we can form the overcategory $(\mathfrak{C}at \downarrow \mathfrak{C})$:

- objects are functors $J: S \to \mathfrak{C}$
- morphisms are pairs $(P: S \rightarrow S', \phi: J \rightarrow J' \circ P)$

P is a functor and ϕ a natural transformation as in the diagram:

Lets consider the functor $\mathit{fun}:\mathfrak{C}\mathit{at}\to\mathfrak{C}\mathit{at}$

Lets consider the functor $\mathit{fun}:\mathfrak{C}\mathit{at}\to\mathfrak{C}\mathit{at}$

•
$$fun(\mathfrak{C}) = (\mathfrak{Cat} \downarrow \mathfrak{C})$$

• $fun(F: \mathfrak{C} \to \mathfrak{D}) : (\mathfrak{C}at \downarrow \mathfrak{C}) \to (\mathfrak{C}at \downarrow \mathfrak{D})$

Lets consider the functor $fun : \mathfrak{C}at \to \mathfrak{C}at$

•
$$fun(\mathfrak{C}) = (\mathfrak{Cat} \downarrow \mathfrak{C})$$

• $fun(F: \mathfrak{C} \to \mathfrak{D}): (\mathfrak{C}at \downarrow \mathfrak{C}) \to (\mathfrak{C}at \downarrow \mathfrak{D})$

That is, fun(F) is a functor:

- for $J: S \to \mathfrak{C}$, $fun(F)(J) = F \circ J: S \to \mathfrak{D}$
- for $(P, \phi : J \rightarrow J' \circ P)$, $fun(F)(P, \phi) = (P, F(\phi))$

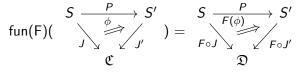

Lets consider the functor $fun : \mathfrak{C}at \to \mathfrak{C}at$

•
$$\mathit{fun}(\mathfrak{C}) = (\mathfrak{Cat} \downarrow \mathfrak{C})$$

• $fun(F: \mathfrak{C} \to \mathfrak{D}) : (\mathfrak{C}at \downarrow \mathfrak{C}) \to (\mathfrak{C}at \downarrow \mathfrak{D})$

That is, fun(F) is a functor:

■ for
$$J : S \to \mathfrak{C}$$
, $fun(F)(J) = F \circ J : S \to \mathfrak{D}$
■ for $(P, \phi : J \to J' \circ P)$, $fun(F)(P, \phi) = (P, F(\phi))$

- consider a natural transformation $I : Id_{fun(\mathfrak{C})} \rightarrow \Delta \circ L$

 $I_J: J \to \Delta_{\mathfrak{C}} \circ L(J)$ is then a morphism in $fun(\mathfrak{C})$ i.e. a collection of maps $I_{J,s}: J(s) \to L(J)$

- Let $L: fun(\mathfrak{C}) \to \mathfrak{C}$ a functor
- for $J: S \to \mathfrak{C}$, $L(J) \in \mathfrak{C}$
- therefore $\Delta(L(J)): * \to \mathfrak{C} \in \mathit{fun}(\mathfrak{C})$
- hence $\Delta \circ L$ is an endofunctor of $fun(\mathfrak{C})$
- consider a natural transformation $I: Id_{fun(\mathfrak{C})} \rightarrow \Delta \circ L$
- $I_J: J \to \Delta_{\mathfrak{C}} \circ L(J)$ is then a morphism in $fun(\mathfrak{C})$ i.e. a collection of maps $I_{J,s}: J(s) \to L(J)$

If $\mathfrak C$ is cocomplete, colimit becomes a functor $\mathit{colim}: \mathit{fun}(\mathfrak C) o \mathfrak C$

- Let $L: fun(\mathfrak{C}) \to \mathfrak{C}$ a functor
- for $J: S \to \mathfrak{C}$, $L(J) \in \mathfrak{C}$
- therefore $\Delta(L(J)): * \to \mathfrak{C} \in \mathit{fun}(\mathfrak{C})$
- hence $\Delta \circ L$ is an endofunctor of $fun(\mathfrak{C})$
- consider a natural transformation $I: Id_{fun(\mathfrak{C})} \rightarrow \Delta \circ L$
- $I_J: J \to \Delta_{\mathfrak{C}} \circ L(J)$ is then a morphism in $fun(\mathfrak{C})$ i.e. a collection of maps $I_{J,s}: J(s) \to L(J)$

If \mathfrak{C} is cocomplete, colimit becomes a functor $colim : fun(\mathfrak{C}) \to \mathfrak{C}$ The canonical morphisms give us a natural $\eta : Id \to \Delta \circ colim$

 $\mathscr{L}_{\mathsf{fun},\mathfrak{C}}$

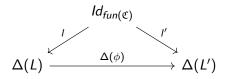

let $\mathscr{L}_{fun,\mathfrak{C}}$ be the category such that:

- objects are pairs $(L, I : Id_{fun(\mathfrak{C})} \rightarrow \Delta_C \circ L)$
- morphisms are natural transformations $\phi: L \rightarrow L'$ such that:

 $\mathcal{L}_{\mathsf{fun}} \sigma$

let $\mathscr{L}_{fun,\mathfrak{C}}$ be the category such that:

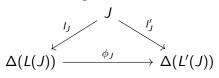

- objects are pairs $(L, I : Id_{fun(\mathfrak{C})} \rightarrow \Delta_C \circ L)$
- morphisms are natural transformations $\phi : L \rightarrow L'$ such that:

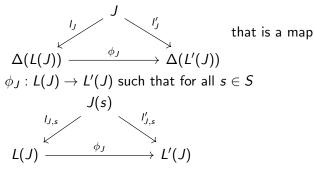

Let's step back: for a small functor $J : S \to \mathfrak{C}$, $\phi_J : L(J) \to L'(J)$ is just a single morphism

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Let's step back: for a small functor $J : S \to \mathfrak{C}$, $\phi_J : L(J) \to L'(J)$ is just a single morphism the above diagram becomes

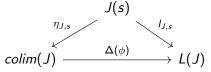

Let's step back: for a small functor $J: S \to \mathfrak{C}$, $\phi_J: L(J) \to L'(J)$ is just a single morphism the above diagram becomes

・ロト ・ 理 ト ・ ヨ ト ・ ヨ ト

If \mathfrak{C} is cocomplete, the universal property of the colimit is exactly the statement that, for all L,J, there is a unique $\phi_J : colim(J) \to L(J)$ such that

that is, colim is initial in the category $\mathscr{L}_{\mathit{fun},\mathfrak{C}}$

Want: initial object in $\mathscr{L}_{sm,\mathfrak{C}}$

Analogously, define $\mathscr{L}_{sm,\mathfrak{C}}$ for the endofunctor $sm:\mathfrak{C}at
ightarrow\mathfrak{C}at$

(ロ)、(型)、(E)、(E)、 E) の(の)

Want: initial object in $\mathscr{L}_{sm,\mathfrak{C}}$

Analogously, define $\mathscr{L}_{sm,\mathfrak{C}}$ for the endofunctor $sm:\mathfrak{C}at \to \mathfrak{C}at$

 \blacksquare the colimit we are looking for should be the initial object in $\mathscr{L}_{\mathit{sm},\mathfrak{C}}$

Analogously, define $\mathscr{L}_{sm,\mathfrak{C}}$ for the endofunctor $sm:\mathfrak{C}at \to \mathfrak{C}at$

 \blacksquare the colimit we are looking for should be the initial object in $\mathscr{L}_{\mathit{sm},\mathfrak{C}}$

Consider the faithful functor $i : fun(\mathfrak{C}) \to sm(\mathfrak{C})$: $i(J) = J, i(P, \phi) = \phi$

- Analogously, define $\mathscr{L}_{sm,\mathfrak{C}}$ for the endofunctor $sm:\mathfrak{C}at \to \mathfrak{C}at$
- \blacksquare the colimit we are looking for should be the initial object in $\mathscr{L}_{\mathit{sm},\mathfrak{C}}$

Consider the faithful functor $i : fun(\mathfrak{C}) \to sm(\mathfrak{C})$: $i(J) = J, i(P, \phi) = \phi$ that is, i forgets that ϕ is a natural transformation, and instead regards it just as a collection of maps $\phi_s : J(s) \to J'(P(s))$, i.e. a submorphism.

Lift i to a functor $i^* : \mathfrak{C}^{sm(\mathfrak{C})} \to \mathfrak{C}^{fun(\mathfrak{C})}$:

$$i^*(L)(J) = L \circ i(J)$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Lift i to a functor $i^* : \mathfrak{C}^{sm(\mathfrak{C})} \to \mathfrak{C}^{fun(\mathfrak{C})}$:

$$i^*(L)(J) = L \circ i(J)$$

and further to a functor $i^*: \mathscr{L}_{sm,\mathfrak{C}} \to \mathscr{L}_{fun,\mathfrak{C}}$

$$i^{*}(\ell: Id_{sm(\mathfrak{C})} \to \Delta_{C} \circ L) = \overline{\ell}: Id_{sm(\mathfrak{C})} \circ i \to \Delta_{C} \circ L \circ i$$
$$= \overline{\ell}: Id_{fun(\mathfrak{C})} \to \Delta_{C} \circ L$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□▶

Lift i to a functor $i^* : \mathfrak{C}^{sm(\mathfrak{C})} \to \mathfrak{C}^{fun(\mathfrak{C})}$:

$$i^*(L)(J) = L \circ i(J)$$

and further to a functor $i^*: \mathscr{L}_{sm,\mathfrak{C}} \to \mathscr{L}_{fun,\mathfrak{C}}$

$$\begin{split} i^*(\ell: \mathit{Id}_{sm(\mathfrak{C})} \to \Delta_C \circ L) &= \bar{\ell} : \mathit{Id}_{sm(\mathfrak{C})} \circ i \to \Delta_C \circ L \circ i \\ &= \bar{\ell} : \mathit{Id}_{fun(\mathfrak{C})} \to \Delta_C \circ L \end{split}$$

Conjecture:

 i^* is faithful and essentially surjective.

Lift i to a functor $i^* : \mathfrak{C}^{sm(\mathfrak{C})} \to \mathfrak{C}^{fun(\mathfrak{C})}$:

$$i^*(L)(J) = L \circ i(J)$$

and further to a functor $i^*: \mathscr{L}_{sm,\mathfrak{C}} \to \mathscr{L}_{fun,\mathfrak{C}}$

$$i^{*}(\ell: Id_{sm(\mathfrak{C})} \to \Delta_{C} \circ L) = \overline{\ell}: Id_{sm(\mathfrak{C})} \circ i \to \Delta_{C} \circ L \circ i$$
$$= \overline{\ell}: Id_{fun(\mathfrak{C})} \to \Delta_{C} \circ L$$

Conjecture:

 i^* is faithful and essentially surjective.

if this is true then $\mathscr{L}_{sm,\mathfrak{C}}$ has an initial object, which will be the colimit $sm(\mathfrak{C}) \to \mathfrak{C}$ we are looking for, but this is still left to prove.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

that is objects are small categories $\mathfrak{C},\mathfrak{D}$

that is

objects are small categories $\mathfrak{C}, \mathfrak{D}$ morphisms are functors $F : \mathfrak{C} \to \mathfrak{D}$

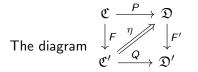

that is objects are small categories $\mathfrak{C}, \mathfrak{D}$ morphisms are functors $F : \mathfrak{C} \to \mathfrak{D}$

2-morphisms are commutative diagrams:

where $\eta: Q \circ F \rightarrow F' \circ P$ is a natural transformation

Simplecies in Cat

Can actually be described entirely by a "2-simplex":

▲□▶ ▲圖▶ ▲臣▶ ▲臣▶ ―臣 … のへで

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

■ categories 𝔅 as 0-simplecies

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

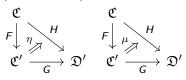

- \blacksquare categories $\mathfrak C$ as 0-simplecies
- functors $F : \mathfrak{C} \to \mathfrak{D}$ as 1-simplecies

- categories 𝔅 as 0-simplecies
- functors $F : \mathfrak{C} \to \mathfrak{D}$ as 1-simplecies
- commutative triangles up to natural transformation as 2-simplecies

- categories 𝔅 as 0-simplecies
- functors $F : \mathfrak{C} \to \mathfrak{D}$ as 1-simplecies
- commutative triangles up to natural transformation as 2-simplecies

Just as two 0-simplecies(categories) can have multiple 1-simplecies(functors) between them

3 functors (1-simplecies) can have multiple natural transformations (2-simplecies) between them

given a 2-simplex
$$\sigma^2 = \begin{array}{c} \mathfrak{C} \\ F \downarrow \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \end{array}$$

<□ > < @ > < E > < E > E のQ @

given a 2-simplex
$$\sigma^2 = \begin{array}{c} \mathfrak{C} \\ F \downarrow \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \end{array}$$

we can extract 3 bits of information, namely the faces: $face_0(\sigma^2) = H$, $face_1(\sigma^2) = F$, $face_2(\sigma^2) = G$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

given a 2-simplex
$$\sigma^2 = \begin{array}{c} \mathfrak{C} \\ F \downarrow \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \end{array}$$

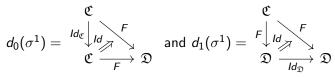

we can extract 3 bits of information, namely the faces: $face_0(\sigma^2) = H$, $face_1(\sigma^2) = F$, $face_2(\sigma^2) = G$

On the other hand, given a 1-simplex: $\sigma^1 = F : \mathfrak{C} \to \mathfrak{D}$, we can get two "degenerate" 2-simplecies:

given a 2-simplex
$$\sigma^2 = \begin{array}{c} \mathfrak{e} \\ F \downarrow \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \\ \mathfrak{C}' \end{array}$$

we can extract 3 bits of information, namely the faces: $face_0(\sigma^2) = H$, $face_1(\sigma^2) = F$, $face_2(\sigma^2) = G$

On the other hand, given a 1-simplex: $\sigma^1 = F : \mathfrak{C} \to \mathfrak{D}$, we can get two "degenerate" 2-simplecies:

if Σ_n is the set of n-simplecies, the faces and degeneracies are, in general, functions:

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

$$\boldsymbol{\Sigma}_{0} \underset{\{f_{i}^{1}\}_{i=0,1}}{\overset{\{d_{0}^{0}\}}{\longleftarrow}} \boldsymbol{\Sigma}_{1} \underset{\{f_{i}^{2}\}_{i=0,1,2}}{\overset{\{d_{i}^{1}\}_{i=1,2}}{\longleftarrow}} \boldsymbol{\Sigma}_{2}$$

if Σ_n is the set of n-simplecies, the faces and degeneracies are, in general, functions:

$$\boldsymbol{\Sigma}_{0} \underset{\{f_{i}^{1}\}_{i=0,1}}{\overset{\{d_{0}^{0}\}}{\longleftrightarrow}} \boldsymbol{\Sigma}_{1} \underset{\{f_{i}^{2}\}_{i=0,1,2}}{\overset{\{d_{i}^{1}\}_{i=1,2}}{\longleftrightarrow}} \boldsymbol{\Sigma}_{2}$$

of course, in more general situations, this chain continues as:

$$\Sigma_{n-1}\underset{\{f_i^n\}_{0\leq i\leq n}}{\underbrace{}\sum_n} \sum_n \underbrace{\{d_i^n\}_{0\leq i\leq n}}_{n} \Sigma_{n+1}$$

Consider the category fin:

Consider the category fin:

• objects are the finite ordered sets [n] = (0, ..., n)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Consider the category fin:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

morphisms are increasing functions

Consider the category fin:

- objects are the finite ordered sets [n] = (0, ..., n)
- morphisms are increasing functions

There are two special types of increasing functions which will represent primordial face and degeneracy maps:

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Consider the category fin:

- objects are the finite ordered sets [n] = (0, ..., n)
- morphisms are increasing functions

There are two special types of increasing functions which will represent primordial face and degeneracy maps: $f_i^n : [n] \rightarrow [n+1], f_i^n(0, ..., i-1, i, n) = (0, ..., i-1, i, ..., n)$

Consider the category fin:

- objects are the finite ordered sets [n] = (0, ..., n)
- morphisms are increasing functions

There are two special types of increasing functions which will represent primordial face and degeneracy maps: $f_i^n : [n] \rightarrow [n+1], f_i^n(0, ..., i-1, i, n) = (0, ..., i-1, i, ..., n)$

 $d_i^n: [n] \to [n-1], \ d_i^n(0, ..., i, i+1, ..., n) = (0, ..., (i, i+1), ..., n)$

Consider the category fin:

- objects are the finite ordered sets [n] = (0, ..., n)
- morphisms are increasing functions

There are two special types of increasing functions which will represent primordial face and degeneracy maps:

$$\begin{array}{l} f_i^n:[n] \to [n+1], \ f_i^n(0,...,i-1,i,n) = (0,...,i-1,,i,...,n) \\ d_i^n:[n] \to [n-1], \ d_i^n(0,...,i,i+1,...,n) = (0,...,(i,i+1),...,n) \end{array}$$

Simplicial Set

A Simplicial Set is then a contravariant functor $\Sigma:\textit{fin} \rightarrow \mathfrak{Set}$

Consider the category fin:

- objects are the finite ordered sets [n] = (0, ..., n)
- morphisms are increasing functions

There are two special types of increasing functions which will represent primordial face and degeneracy maps:

$$\begin{array}{l} f_i^n:[n] \to [n+1], \ f_i^n(0,...,i-1,i,n) = (0,...,i-1,,i,...,n) \\ d_i^n:[n] \to [n-1], \ d_i^n(0,...,i,i+1,...,n) = (0,...,(i,i+1),...,n) \end{array}$$

Simplicial Set

A Simplicial Set is then a contravariant functor $\Sigma:\textit{fin} \rightarrow \mathfrak{Set}$

A morphism of simplicial sets, is then just a natural transformation $\eta:\Sigma\to\Sigma'$

naturality with respect to face maps gives:

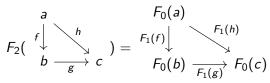

naturality with respect to face maps gives:

that is: $F(g \circ f) = F(g) \circ F(g)$

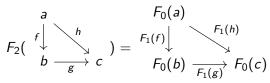

naturality with respect to face maps gives:

that is: $F(g \circ f) = F(g) \circ F(g)$

naturality with respect to degeneracy gives $F(Id_a) = Id_{F(a)}$

naturality with respect to face maps gives:

that is: $F(g \circ f) = F(g) \circ F(g)$

naturality with respect to degeneracy gives $F(Id_a) = Id_{F(a)}$ i.e. a natural transformation between 1-categories (as simplicial sets) is actually just a functor.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Ontologies represent concepts and relations between them

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Ontologies represent concepts and relations between them
- Simplicial Sets allow us to stage morphisms as concepts and use 2-simplecies to find relations between morphisms, (or relations between relations).

- Ontologies represent concepts and relations between them
- Simplicial Sets allow us to stage morphisms as concepts and use 2-simplecies to find relations between morphisms, (or relations between relations).
- the naive definition of a higher ontology, then, should be a simplicial set

- Ontologies represent concepts and relations between them
- Simplicial Sets allow us to stage morphisms as concepts and use 2-simplecies to find relations between morphisms, (or relations between relations).
- the naive definition of a higher ontology, then, should be a simplicial set

The theory of Simplicial Sets is pretty well developed (almost as well as category theory) and so sSet gives a great starting point for capturing the intuition behind what a higher ontology should be

The second benefit to using simplicial sets is that, a priori, composition isn't computed, but **given**

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The second benefit to using simplicial sets is that, a priori, composition isn't computed, but **given** In a 1-category, for any two composable morphisms $f: a \rightarrow b, g: b \rightarrow c$ there is always a 2-simplex:

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

The second benefit to using simplicial sets is that, a priori, composition isn't computed, but **given** In a 1-category, for any two composable morphisms $f: a \rightarrow b, g: b \rightarrow c$ there is always a 2-simplex: $a \xrightarrow{f \downarrow} \xrightarrow{g \circ f} c$

In an abstract simplicial set one need not have a 2-simplex for every composable pair $f: a \rightarrow b, g: b \rightarrow c$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

In an abstract simplicial set one need not have a 2-simplex for every composable pair $f : a \to b, g : b \to c$ This allows us to get away with representing morphisms without having to compute potentially infinite chains of maps

In an abstract simplicial set one need not have a 2-simplex for every composable pair $f : a \to b, g : b \to c$ This allows us to get away with representing morphisms without having to compute potentially infinite chains of maps

(日) (同) (三) (三) (三) (○) (○)

(for example if $f : a \rightarrow a$, $f^{(n)}$ is always defined)

In an abstract simplicial set one need not have a 2-simplex for every composable pair $f : a \to b, g : b \to c$ This allows us to get away with representing morphisms without having to compute potentially infinite chains of maps

(for example if $f : a \rightarrow a$, $f^{(n)}$ is always defined)

■ simplex.level = n

- simplex.level = n
- simplex.faces = n-tuple of simplecies with level n-1

- simplex.level = n
- simplex.faces = n-tuple of simplecies with level n-1
- simplex.degeneracy = n-tuple of simplecies with level n+1

- simplex.level = n
- simplex.faces = n-tuple of simplecies with level n-1
- simplex.degeneracy = n-tuple of simplecies with level n+1

A simplicial set is then just a collection of simplex objects containing its degeneracies and faces

A functor between simplicial sets is then just a function F between the collections of simplex objects satisfying simple naturality assertions:

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

A functor between simplicial sets is then just a function F between the collections of simplex objects satisfying simple naturality assertions:

code

for simplex in simpset:

```
\begin{array}{l} \mbox{assert } F(simplex.faces) = F(simplex).faces \\ \mbox{assert } F(simplex.degeneracies) = F(simplex).degeneracies \end{array}
```

A functor between simplicial sets is then just a function F between the collections of simplex objects satisfying simple naturality assertions:

code

for simplex in simpset:

```
\begin{array}{l} \mbox{assert } F(simplex.faces) = F(simplex).faces \\ \mbox{assert } F(simplex.degeneracies) = F(simplex).degeneracies \end{array}
```

you can view my working code at https://github.com/nopounch/golog

The following is a work in progress:

The following is a work in progress:

The idea is to consider the collections of face maps and degeneracy maps as small functors:

- face : $\Sigma \to sm(\Sigma)$
- degen : $\Sigma \to sm(\Sigma)$

The following is a work in progress:

The idea is to consider the collections of face maps and degeneracy maps as small functors:

- face : $\Sigma \to sm(\Sigma)$
- degen : $\Sigma \rightarrow sm(\Sigma)$
- i.e. $face_n : \Sigma_n \to (\Sigma_{n-1})^n$, $degen_n : \Sigma_n \to (\Sigma_{n+1})^n$

The following is a work in progress:

The idea is to consider the collections of face maps and degeneracy maps as small functors:

- face : $\Sigma \to sm(\Sigma)$
- degen : $\Sigma \rightarrow sm(\Sigma)$
- i.e. $face_n : \Sigma_n \to (\Sigma_{n-1})^n$, $degen_n : \Sigma_n \to (\Sigma_{n+1})^n$

The functorality here isn't apparent, and may necessitate working with something close to but not exactly simplicial sets.
